THE FRAMEWORK · SHOWN IN FULL

The Three-Phase 90-Day Sequence

Adoption fails when governance and deployment are treated as sequential. They are not. They run in parallel, phase by phase, and the sequence below is what separates a capability from an exposure.

- 1** **DAYS 1 TO 30 · ASSESS AND STABILIZE**
Survey what your team says they use, then pull the actual list from IT including browser extensions and cloud apps. The gap between those two lists is your shadow Ai exposure map. Then map workflows and assess compliance constraints. You deploy nothing in this phase.
- 2** **DAYS 31 TO 60 · STRUCTURE AND DEPLOY**
Two tracks run at once. The governance track drafts policy answering five specific questions. The deployment track ships the first use case, usually meeting summaries or SOP drafting. You do not finish governance before beginning deployment. You build governance for each area before that area deploys.
- 3** **DAYS 61 TO 90 · GOVERN AND SCALE**
Complete the governance documentation, measure what the first deployments actually changed, and build internal capability with one Ai champion per department minimum. Organizations that cannot measure what Ai adoption changed cannot defend it.

HOW TO USE IT

Run the tool and usage discovery in the first ten days before anything else. The gap between reported and actual usage determines how aggressive the rest of your sequence needs to be.

INSIDE THE VOLUME

You just used one. The system has more.

DEPLOYMENT-READY

FRAMEWORKS, TOOLS & TEMPLATES INSIDE

- + The Shadow Ai Exposure Map
- + The Automation Candidacy Score
- + The Decision Classification Framework (Ai Assisted, Human Decided, Ai Excluded)
- + Quick Win deployment windows
- + The 24-Hour Data Exposure Protocol
- + The Ai Readiness Audit (four instruments)
- + The Change Readiness Scorecard
- + The Five Failure Modes of Adoption
- + 25 deployment-ready prompts

AFTER THIS VOLUME YOU CAN

- Find the gap between the Ai your team reports using and the Ai they actually use
- Score any workflow for automation candidacy before committing to it
- Classify which decisions Ai may assist, which require a human, and which Ai must never touch
- Deploy at least two use cases with documented time savings inside ninety days
- Build governance in parallel with deployment instead of after the first incident

Ai does not fix broken systems. It reveals them. It accelerates whatever already exists. If you automate before you standardize, you do not solve a problem. You simply accelerate the mess.
